Composite Messenger Antenna
Array 8 (CMAA8)
12 dB, 1.7 – 2.5 GHz, Seven-Panel Array Plus Up-look Antenna Family

The most important thing we build is trust.

Applications
- Long Distance A/V Mobile Links
- Airborne Surveillance Links
- Electronic News Gathering (ENG)
- Repeaters
- UAV/UGV Applications

Key System Features
(when used with COBHAM’ ProRX Receiver)
- Low-Cost Tracking Antenna
- Provides 1.7 – 2.5 GHz Hemispherical Coverage
  (w/BDCC 1.7 – 1.85 GHz or 1.99 – 2.5 GHz)
- Fully Electronic Tracker
  ▪ No moving parts!
  ▪ High Reliability!
- Fully Automatic & Self-Contained
  ▪ No GPS required!
  ▪ No special equipment needed on the remote TX!
- Track multiple objects with one CMAA!
- Integral Block Down Converters or Low Noise Amplifiers optional
- Rugged Weather Proof Enclosure
- Optional Lightning Protection

COBHAM’ Composite Messenger Antenna Arrays (CMAA) provides a reliable, cost effective alternative to conventional electro-mechanical Dual-Axis or Single-Axis Auto-Tracking Antenna Systems. When used with COBHAM’ COFDM Professional Receiver (ProRX) [Sold Separately], this linear-polarized, wide-bandwidth (1.7 – 2.5 GHz) antenna array provides auto-tracking over an Hemispherical-pattern for one or multiple DVB-T COFDM Audio/Video compliant transmissions with 12 dB gain. It is a fully electronic system, designed for harsh outdoor environments!

The CMAA8, when used in conjunction with the high-performance ProRX, provides Maximal-Ratio Pre-Detection Diversity Combining that effectively sums the RF energy presented to any of the antennas. This capability, in conjunction with the equally spaced high-gain panel antennas, automatically provides reliable tracking of airborne transmission. At the crossover points between any two panel antennas, the ProRX’s Pre-Detect Combining eliminates the dip in the receive pattern by adding an additional 2.5 dB gain through this region. Additionally, the CMAA8 has an up-look antenna to ensure coverage when the aircraft flies over the CMAA8.
Composite Messenger Antenna Array 8 (CMAA8)

12 dB, 1.7 – 2.5 GHz, Seven-Panel Array Plus Up-Look Antenna Family

Another key attribute of the Composite Messenger Antenna Array/ProRX combination is that, unlike other systems that use GPS for positioning, there is no special equipment required at the transmitter. This capability greatly simplifies the implementation in the airborne vehicle.

Figure 1: Multiple-Object Auto-Tracking Configuration

As shown in Figure 1, a single CMAA8 can be used to simultaneously track multiple transmitters. This is accomplished by adding commercial UHF/VHF splitters to the IF output of each Antenna Array Element and then distributing the split IF signals to multiple ProRXs, one ProRX for each tracked vehicle. This capability is not possible with conventional electro-mechanical tracking systems!

The CMAA8 consists of seven vertically polarized panel antennas each with 12 dB gain arranged in a uniform periphery (7 elements) for omni-directional coverage. Plus a RHCP Bifilar Helical Up-Look antenna to cover flight patterns above the array. All the antennas are contained in a single splash-proof, all-weather housing.

There are two basic configurations available “Radio Frequency” (RF) and “Intermediate Frequency” (IF) with multiple bands available for the “IF” models.

Radio Frequency (RF): RF-only models can be supplied with internal Low Noise Amplifiers (LNAs) for each antenna element or no internal electronics. RF-only models will output RF through 50-Ohm, N-FM connectors for all 8 antenna elements.
Composite Messenger Antenna
Array 8 (CMAA8)

12 dB, 1.7 – 2.5 GHz, Seven-Panel Array Plus Up-Look Antenna Family

Intermediate Frequency (IF): The “IF” CMAA8 models contain internally mounted Block Down-Converter Cards (BDCCs) for each antenna element. Note that the BDCC limits the systems frequency range to either 1.7 – 1.85 GHz or 1.99 – 2.5 GHz. The system antenna elements will output “IF” signals 700 – 550 MHz or 810 – 300 MHz through a set of 75-Ohm, TNC-FM connectors.

The 3dB Beamwidth of each panel antenna is ~47 - ~56 degrees in azimuth and ~14 - ~20 degrees in elevation. Each of these antennas is tilted upward by 5 degrees to optimize antenna maximum gain to just above the horizontal plane.

Figure 2 is representative of the elevation pattern of the array. Gain is 12 dBi at 10 degrees elevation. It will be observed that gain on the horizon is about 11 dBi. The up-look antenna provides 4 dB of gain directly overhead with higher gain at lower elevations to provide optimum coverage of overhead passes.
Composite Messenger Antenna Array 8 (CMAA8)

12 dB, 1.7 – 2.5 GHz, Seven-Panel Array Plus Up-Look Antenna Family

Likewise, Figure 3 is representative of the azimuth pattern at 10 degrees elevation. The gain on the horizon is expected to be 11 dBi and the pattern is identical.

![Figure 3: Projected Panel Antenna Azimuth Pattern](image)

The net effect of these eight antennas and the diversity properties of the COFDM receivers are to provide unbroken aircraft coverage over a hemispherical-pattern without resort to moving parts (mechanical auto trackers). Note that from a system standpoint the dip at the cross-over point between any of the two antenna elements will be eliminated due to the Pre-Detect Diversity Combining gain of the PRORX receiver. This provides excellent coverage over a modified OMNI pattern.

The internal pipe mount bracket can accommodate pipe sizes from 2” to 6”. We also offer offset-mount and magnetic mount options. The offset-mount option is shown in Figure 4.
Composite Messenger Antenna Array 8 (CMAA8)

12 dB, 1.7 – 2.5 GHz, Seven-Panel Array Plus Up-Look Antenna Family

The tracking ability of the CMAA8 and PRORX combination is enabled by the PRORX's Multiple-Input Maximal-Ratio Diversity Combining ability that sums the signals of up to eight independent receive paths. Maximal-Ratio Diversity Combining can increase the Signal to Noise Ratio (SNR) by 2.5 dB or 78% for two inputs if the antennas are getting the same signal from a transmitter.
